0.2% of Pacific oyster proteins are dark (no label), against 0.4% of human proteins.

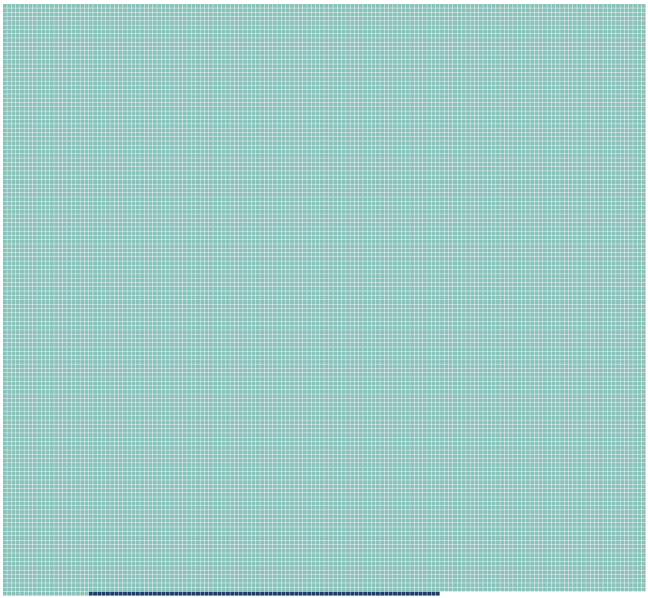
Proteins: UniProt 2026_03 one-protein-per-gene sets. Dark: none of these labels the protein.
AlphaFold DB: model AF-<accession>-F1 (v6)
InterPro: the matches UniProt lists from InterPro 110.0
Swiss-Prot hit: MMseqs2 18.8cc5c against Swiss-Prot 2026_03, identity > 30%

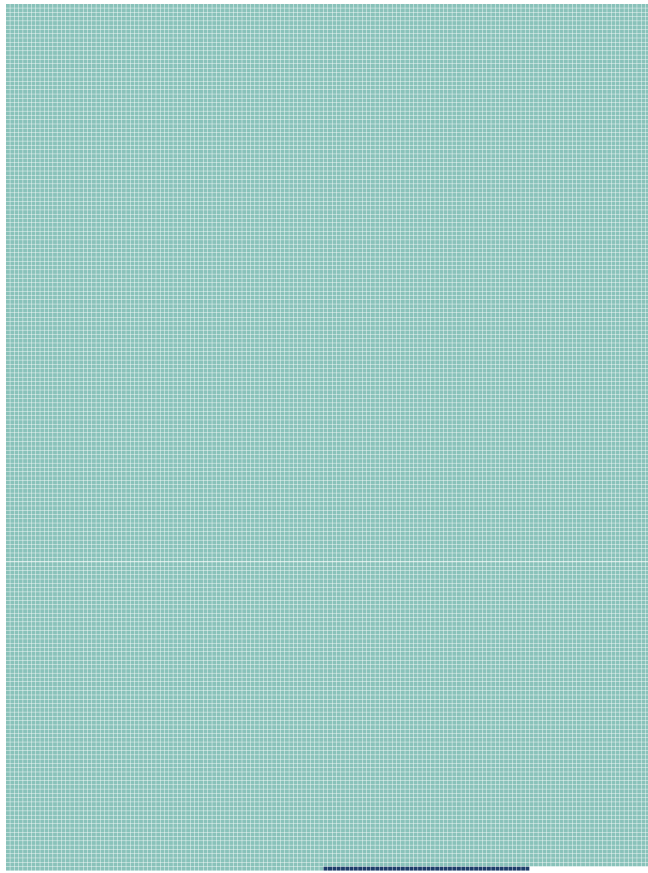
One tile = one protein; 150 tiles per row and the same tile size in both maps; lit tiles first, then dark

lit: the protein has an AlphaFold DB model for that accession, an InterPro match, or a Swiss-Prot hit above 30% identity (a hit to its own entry counts)

dark: none of these

Human (Homo sapiens), 20,652 proteins
20,570 lit (99.6%), 82 dark (0.4%)





Pacific oyster (Crassostrea gigas), 30,272 proteins
30,224 lit (99.8%), 48 dark (0.2%)
