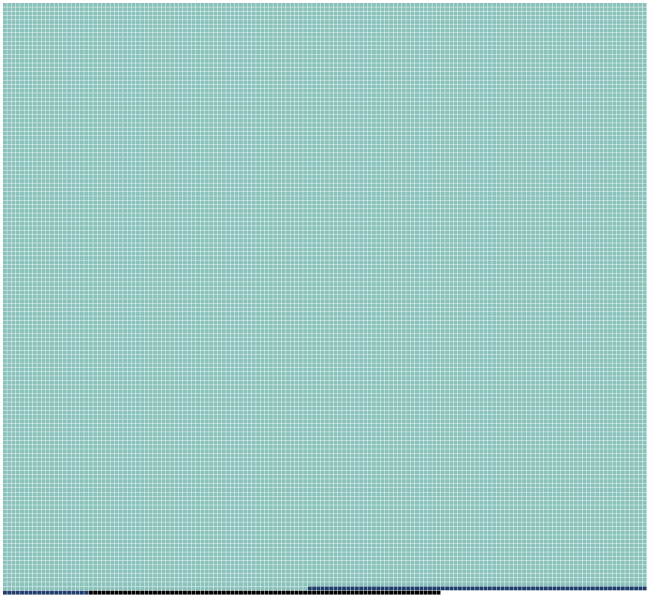
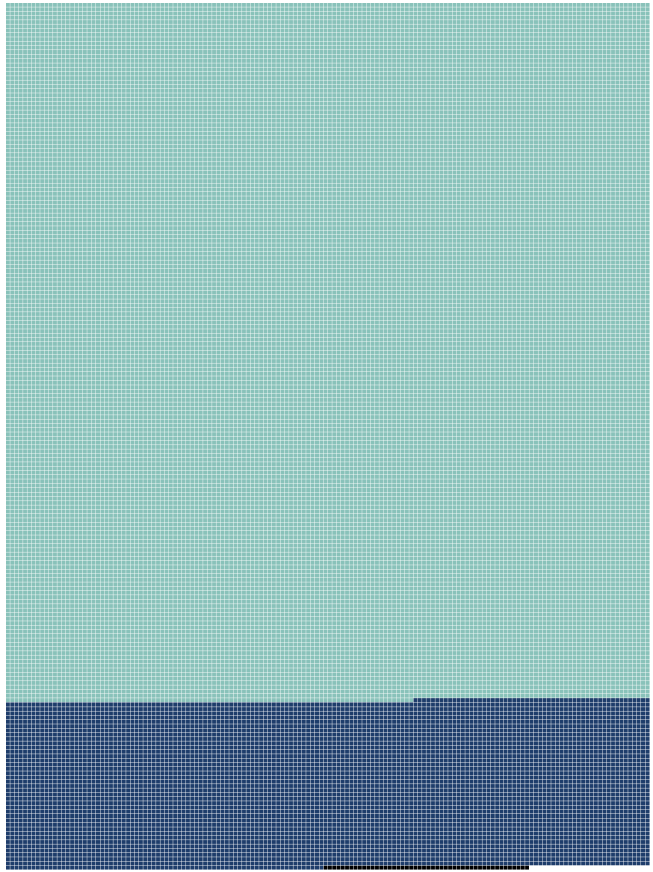
A model is not a label: 94.85% of oyster proteins have an AlphaFold DB model; 19.41% have no function label.

Proteins: UniProt 2026_03 one-protein-per-gene sets. The same proteins and order of lit and dark as the first map; here the dark tiles are split by whether AlphaFold DB has a model.
InterPro: the matches UniProt lists from InterPro 110.0
Swiss-Prot hit: MMseqs2 18.8cc5c against Swiss-Prot 2026_03, identity > 30%
AlphaFold DB: model AF-<accession>-F1 (v6)
One tile = one protein; 150 tiles per row, the same tile size as the first map; lit tiles first, then dark with a model, then dark without

- lit: an InterPro match or a Swiss-Prot hit above 30% identity (a hit to its own entry counts)
- dark, but AlphaFold DB has a model: a predicted structure, which names no function
- dark, and no AlphaFold DB model

Human (Homo sapiens), 20,652 proteins
20,471 lit (99.1%); dark 181 (0.9%): 99 with a model, 82 without





Pacific oyster (Crassostrea gigas), 30,272 proteins
24,395 lit (80.6%); dark 5,877 (19.4%): 5,829 with a model, 48 without
